

Model 1:N relationships with foreign keys

Timo Grossenbacher Data Journalist

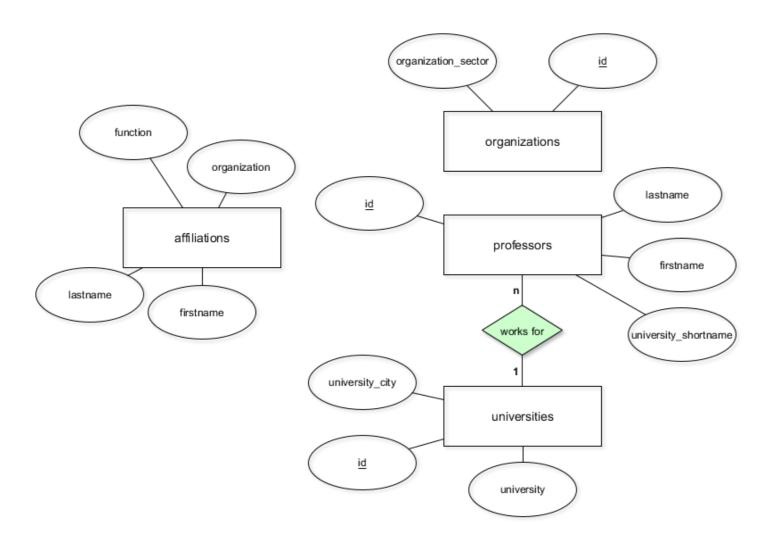

The current database model

The next database model

Implementing relationships with foreign keys

- A foreign key (FK) points to the primary key (PK) of another table
- Domain of FK must be equal to domain of PK
- Each value of FK must exist in PK of the other table (FK constraint or "referential integrity")
- FKs are not actual *keys*

SELECT * FROM professor id firstname		university_shortname
1 Karl		
EPF ETH Lausanne Lausanne ETH ETH Zürich Zurich UBA Uni Basel Basel UBE Uni Bern Bern UFR Uni Freiburg Fribourg UGE Uni Genf Geneva ULA Uni Lausanne Lausanne UNE Uni Neuenburg Neuchâtel USG Uni St. Gallen Saint Gallen USI USI Lugano Lugano UZH Uni Zürich Zurich		

Specifying foreign keys

```
CREATE TABLE manufacturers (
 name varchar(255) PRIMARY KEY
);
INSERT INTO manufacturers
VALUES ('Ford'), ('VW'), ('GM');
CREATE TABLE cars (
 model varchar(255) PRIMARY KEY,
 manufacturer_name integer REFERENCES manufacturers (name)
);
INSERT INTO cars
VALUES ('Ranger', 'Ford'), ('Beetle', 'VW');
```

```
-- Throws an error!
INSERT INTO cars
VALUES ('Tundra', 'Toyota');
```

Specifying foreign keys to existing tables

```
ALTER TABLE a
ADD CONSTRAINT a_fkey FOREIGN KEY (b_id) REFERENCES b (id);
```

Let's implement this!

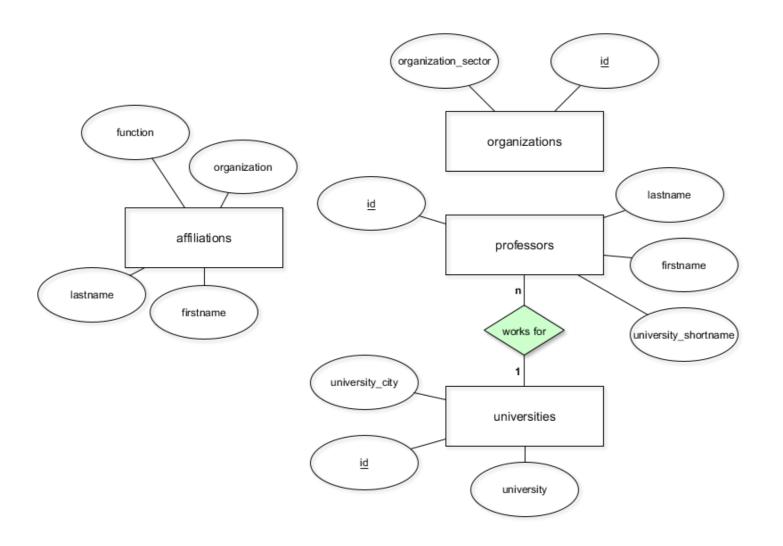

Model more complex relationships

Timo Grossenbacher Data Journalist

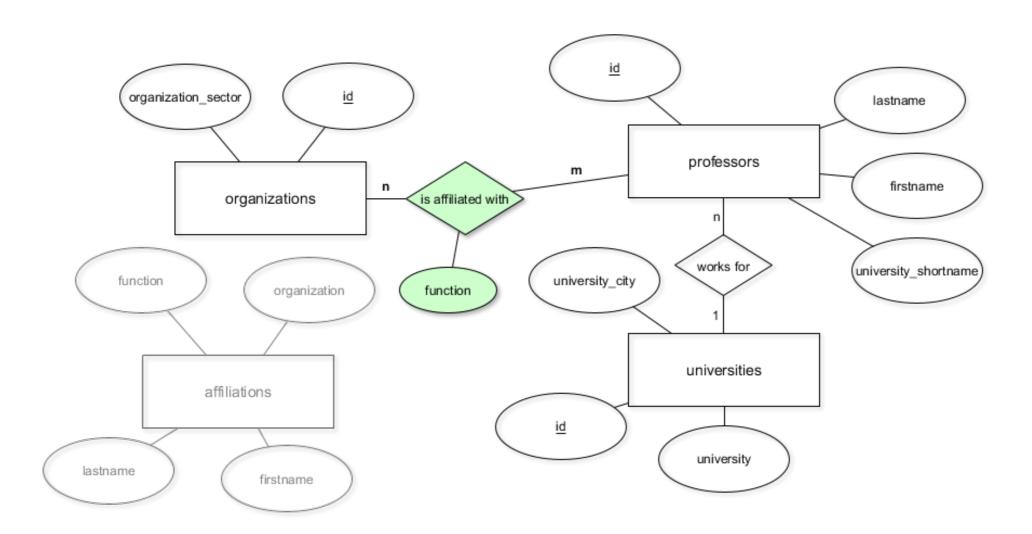

The current database model

• 1:N-relationships are implemented with one foreign key

The final database model

How to implement N:M-relationships

- Create a table
- Add foreign keys for every connected table
- Add additional attributes

```
CREATE TABLE affiliations (
  professor_id integer REFERENCES professors (id),
  organization_id varchar(256) REFERENCES organization (id),
  function varchar(256)
);
```

- No primary key!
- Possible PK = {professor_id, organization_id, function}

Time to implement this!

Referential integrity

Timo Grossenbacher Data Journalist

Referential integrity

- A record referencing another table must refer to an existing record in that table
- Specified between two tables
- Enforced through foreign keys

Referential integrity violations

Referential integrity from table A to table B is violated...

- ...if a record in table B that is referenced from a record in table A is deleted.
- ...if a record in table A referencing a non-existing record from table B is inserted.
- Foreign keys prevent violations!

Dealing with violations

```
CREATE TABLE a (
id integer PRIMARY KEY,
column_a varchar(64),
...,
b_id integer REFERENCES b (id) ON DELETE NO ACTION
);
```

```
CREATE TABLE a (
id integer PRIMARY KEY,
column_a varchar(64),
...,
b_id integer REFERENCES b (id) ON DELETE CASCADE
);
```

Dealing with violations, contd.

ON DELETE...

- ...NO ACTION: Throw an error
- ...CASCADE: Delete all referencing records
- ...RESTRICT: Throw an error
- ...SET NULL: Set the referencing column to NULL
- ...SET DEFAULT: Set the referencing column to its default value

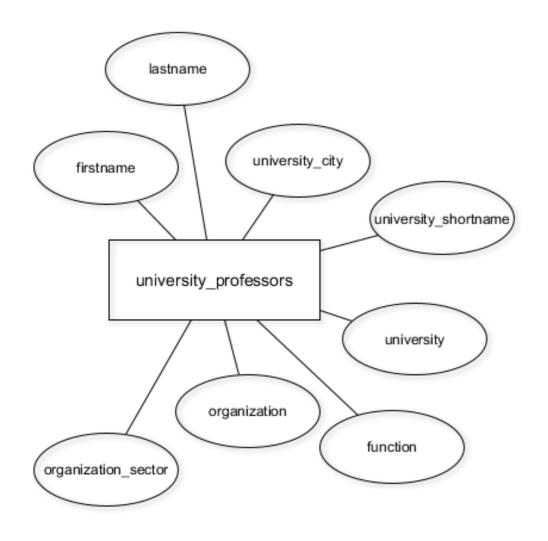

Let's look at some examples!

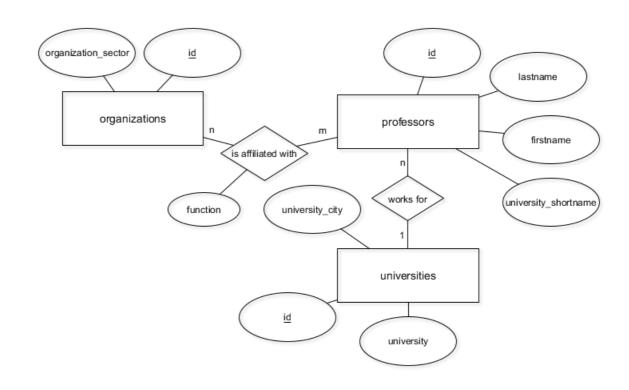

Roundup

Timo Grossenbacher Data Journalist

How you've transformed the database

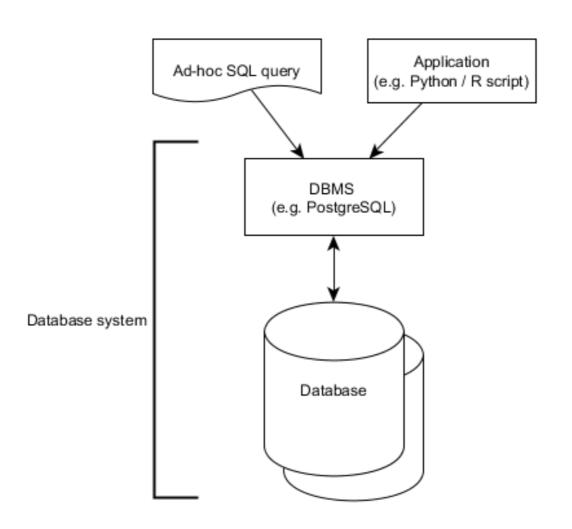

- Column data types
- Key constraints
- Relationships between tables

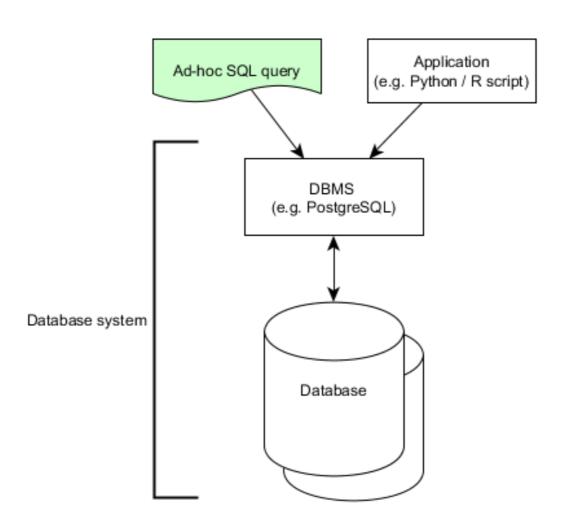

The database ecosystem
